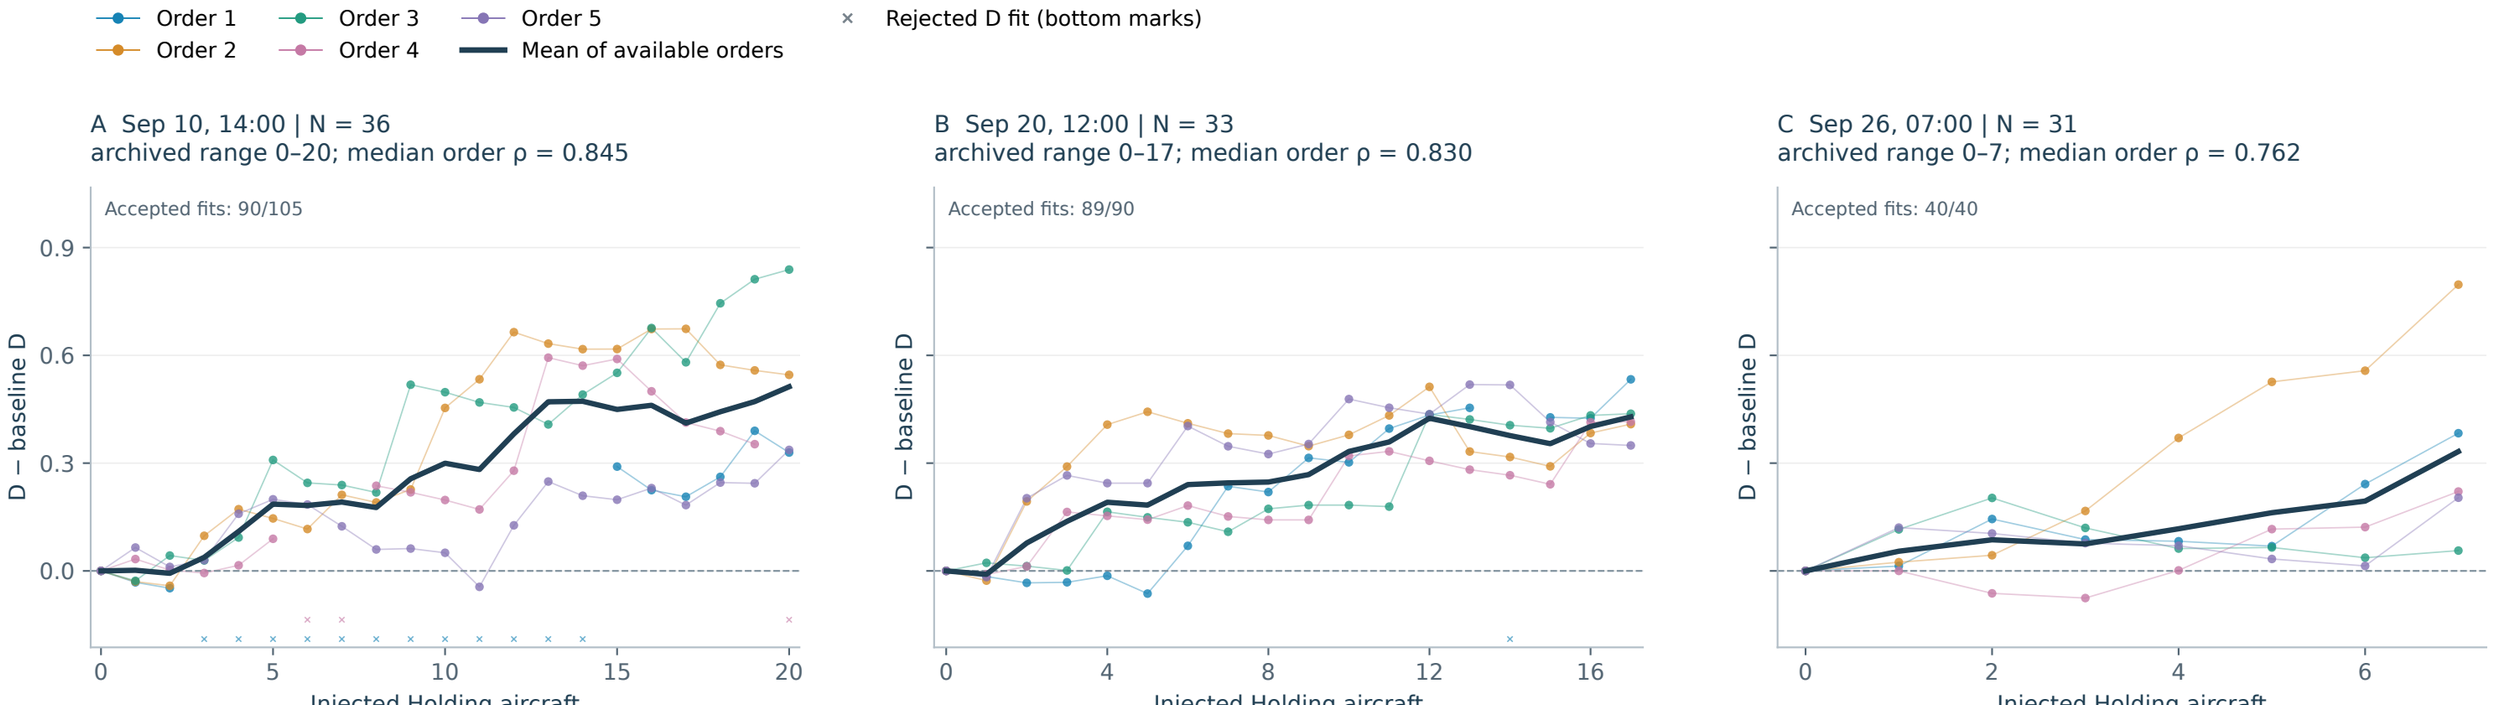
Holding: response within archived pre-peak ranges

Corrected 10-second midpoint injection • +240 seconds • all 3 scenes with an accepted baseline • times UTC+08



Hour-based source selection; injected trajectories retain their complete tails and may extend beyond the source hour.

Cutoffs are inherited outcome-selected peaks (included), not validated operating limits. Full ranges and unavailable scenes appear in the companion report.

No smoothing or new D fits. Missing values break lines. Means use available orders; $R^2 \geq 0.98$ unchanged. Equal-duration control is reported separately.

Baseline-valid subset: 14/15 positive order coefficients, median ρ = 0.800. Orders are dependent repeats; the response is not uniformly monotonic.
