Holding dose–dimension response

Only archived historical dose ranges shown; full ranges and control in Appendix H

Scope: all 7 scenes with an archived cutoff (of 12 planned). Five scenes have no cutoff; all 12 appear in Appendix H.

ρ uses jointly valid Holding/straight doses within the cutoff; curves use available Holding fits. Missing doses break lines; panel y-scales differ.

Historical cutoffs were outcome-derived, not independently validated operating limits. Equal-duration straight control: median ρ = 0.598 (Appendix H).

$R^2 \geq 0.98$ unchanged. Orders are dependent repeats; no confidence intervals or p-values. All scene times are UTC+08.
